DETAILED ACTION

Response to Arguments

1. Applicant's arguments, see Remarks, filed on 8/26/2009, with respect to rejection of claim 1 have been fully considered, wherein Applicant argues that combination rejection of claims over **Wong (US 6,261,497) in view of either Brannon et al. (US 2,400,482) or Krumdieck (US 5,550,033)**, wherein Wong describes preparing a controlled pore glass embedded synthetic resin membrane, which begins by mixing CPG with an aqueous dispersion of thermoplastic polymer resin to form a paste like mass, gelling the mass and then calendaring the gelled mass in several passes to produce a sheet, wherein the amount of water required in the mixture is an important variable to produce the needed flow rate for obtaining a uniform dispersion or homogeneity, while also assuring that the resulting sheet has suitable rigidity. Thus, the amount of water needed is a function of the pore volume of the CPG particles. Wong further teaches that the sintered sheet may then be subjected to surface modification, e.g., by silanization, to provide functional groups for binding biological moieties, wherein the modified sheets can washes to remove any excess silane and baked in an oven. Applicant argues that present invention recites mixing of aqueous free polyalkylene with silane modified CPG prior to filling the wells, heating and cooling the mixture, wherein the CPG is modified before mixing with polyalkylene, and, on the other hand Wong discloses the step of silanification of CPG occurs at the very end of the fabrication process thus, this important difference is related to two other differences between the instant claims and the Wong patent. Applicant's arguments have been fully considered and are persuasive, and, therefore, the rejection of claims has been **withdrawn**.

Allowable Subject Matter

2. Claims 1-7 and 21 are allowed.
3. The following is an examiner's statement of reasons for allowance: The prior arts of record fail to teach or suggest a method of manufacturing cylindrical polyalkylene

embedded silane-modified CPG devices as cited in claims of the instant application. The closet prior art, **Wong (US 6,261,497)** discloses an invention describes preparing a controlled pore glass embedded synthetic resin membrane, which begins by mixing CPG with an aqueous dispersion of thermoplastic polymer resin to form a paste like mass, gelling the mass and then calendaring the gelled mass in several passes to produce a sheet, wherein the amount of water required in the mixture is an important variable to produce the needed flow rate for obtaining a uniform dispersion or homogeneity, while also assuring that the resulting sheet has suitable rigidity. However, Wong fails to disclose step of “...mixing an aqueous free polyalkylene with a silane modified CPG...” as cited in claim 1 of the instant application. None of the above references, taken alone or in combination, inter alia teaches or fairly suggests the method of manufacturing cylindrical polyalkylene embedded silane-modified CPG devices as set forth in the claims of the instant application.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled “Comments on Statement of Reasons for Allowance.”
